Open to remote opportunities from Tunisia and international relocation with employer sponsorship or by mutual agreement.

Summary

Platform and Infrastructure Engineer with 6+ years of hands-on experience across cloud infrastructure, DevOps, production reliability, Kubernetes, observability, automation and database operations. Nearly four years owning production infrastructure for an international marketplace, spanning Linux/Nginx/Passenger, PostgreSQL, Redis, monitoring, Cloudflare edge operations, incident escalation, controlled change, rollback planning and infrastructure automation.

Experience

Apprentus — DevOps Engineer | Functional Platform & Infrastructure Lead • Jul 2022–Jul 2026

- Owned cross-boundary production outcomes and served as principal escalation across application, infrastructure, database, networking, monitoring, edge/security and real-time communications.
- Reviewed production changes, investigated incidents and coordinated validation, rollback and recovery across application and infrastructure stakeholders.
- Contributed to PostgreSQL optimization that reduced storage from 199 GiB to 133 GiB, reclaiming 66 GiB (~33%).
- Modernized a secure multidomain Jitsi/Jibri recording platform with strict JWT authentication, automated DNS-01 certificates, reversible proxy cutover and a validated multi-worker export path.
- Validated five parallel recording workers with successful exports and idempotent reruns.
- Implemented a controlled Cloudflare edge integration with full TLS, HTTPS enforcement, modern protocol support and conservative delivery settings while preserving rollback awareness.
- Authored a read-only infrastructure audit/evidence pipeline and coordinated validated, rollback-ready changes across engineering stakeholders.
- Supervised and mentored a DevOps intern for approximately six months; functional leadership, not formal HR people management.

UBIAI — Cloud & DevOps Engineer • Remote, USA-based • Mar 2021–Jun 2022

- Designed and supported AWS infrastructure across ECS, EC2 and Lambda-based workloads.
- Investigated memory and application bottlenecks and developed practical, metric-driven scaling and resource-optimization recommendations.
- Improved CI/CD and infrastructure observability using CloudWatch, Prometheus and Grafana while collaborating with product and engineering stakeholders.

iPrécision — Cloud & DevOps Engineer • Tunis, Tunisia • Jan 2020–Feb 2021

- Designed and deployed an AWS cloud platform using Amazon EKS, Kubernetes, Helm and containerized application services.
- Built Jenkins-based CI/CD workflows and centralized infrastructure/application telemetry with Elasticsearch, Kibana and Metricbeat.
- Configured observability dashboards and unsupervised anomaly-detection jobs, then ran a controlled DDoS-style load test to validate detection and operational investigation.
- Exercised deployment validation, rollback and recovery procedures without claiming the anomaly model itself stopped traffic.

Selected Platform Work

Production PostgreSQL Storage Optimization

- Investigated operational storage pressure, classified reclaimable data and planned an intervention around lock, availability, backup and recovery concerns.
- Verified a reduction from approximately 199 GiB to 133 GiB, reclaiming 66 GiB (approximately 33%), then monitored the post-change state without inferring unsupported performance or cost savings.

Secure Recording Platform Modernization

- Coordinated strict JWT authentication, negative-path tests, multidomain DNS, DNS-01 certificate automation, Nginx/WebSocket cutover and Docker service rebinding.
- Prepared apply/rollback automation and validation procedures covering recording, export, reruns and failure investigation.

Applied Infrastructure Audit Pipeline

- Built read-only collection controls, structured inventories, raw/sanitized output separation and multi-format safety scans for infrastructure review.
- Kept inaccessible systems explicitly unresolved rather than turning missing evidence into guessed state.

Leadership & Teaching

- Technical Instructor at Leaders University Nabeul (Oct 2024–2026): delivers Virtualisation and Cloud instruction and designs applied AWS/Linux and Flask/PostgreSQL security labs.
- Transfers production practices through repeatable environments, validation, teardown, authorized-use guidance and practical mentoring.

Education

- Professional Master's in Big Data — Bien, awarded Jan 2022
- Applied Bachelor's in Computing and Business Administration (Business Computing) — Bien, awarded Jul 2019
